

Signoz Governer

Autonomous Safety on AI Agents - Built on Signoz

CLOUD INNOVATION HOUR

*When an AI agent goes wrong, most tools tell you about it.
This one does something about it.*

Presented by: Wasim Khan

Problem

AI agents don't fail loudly — they fail quietly

Stuck in a loop

Retries the same broken action forever — no crash, no error, just wasted cycles.

Runaway spend

Many small, unremarkable calls quietly add up to a real bill by the time anyone notices.

Unsafe actions

A prompt injection or misconfiguration lets an agent reach a capability it never should have.

\$6,531

A real, widely-cited cloud bill run up overnight by a single agent stuck in a retry loop

This isn't a hypothetical. Every observability tool shows this after it happens — a dashboard, a graph, a trace you scroll through once you already know something's wrong.

Datadog · Grafana vs Governor

What You Get Out of the Box

Capability	Datadog · Grafana	Governor
Detection basis	Dashboards + manual thresholds a human configures and watches	✓ Same detection logic , running continuously on live SigNoz trace data
What it catches	General infra/app anomalies (latency, errors, resource usage)	✓ Agent-specific patterns : loops, consecutive failures, cost blowing past a cap
Data source	Its own metrics/dashboard pipeline	✓ SigNoz's own trace data — no separate ledger to fall out of sync
On incident	Notifies a human	✓ Pauses the agent within seconds — no human has to be watching to catch it
Recovery	Human decides and acts manually	✓ Human still decides recovery — Governor pauses and hands off, doesn't blindly auto-restart
Memory	Incident is logged; next time still needs a human to notice again	✓ Creates a real, permanent SigNoz alert rule — SigNoz alone catches it next time
Flow	Detect → Notify a human	✓ Detect → Act → SigNoz remembers

Bottom line: Datadog · Grafana = Manual config & alert triage
Governor = Autonomous remediation, permanent rules & memory

DETECTORS

Anomalous tool call

A sensitive action, or injection-style phrasing in a tool call

Loop

Same tool, same arguments, 3 calls in a row

Consecutive failures

3 failed attempts with no success in between

Cost velocity

Spend accelerating fast in a recent window

Absolute cost cap

Total session cost crosses a hard ceiling
